Abstract

We present a computational mathematical framework based on the structural axiom $0^0 = i$, the octonion algebra $\mathbb{O}$, the exceptional Jordan algebra $J_3(\mathbb{O})$, and the E_8 root system. The framework generates a dimensional chain $0^0 = i \rightarrow \mathbb{C} \rightarrow \mathbb{H} \rightarrow \mathbb{O} \rightarrow 8D \rightarrow 6D$ interior, with a $1/8$ consciousness aperture arising from the ratio $421/3375 = 1/8 - 7/27000$. All arithmetic is verified using Q128.128 fixed-point arithmetic (256-bit signed, round-to-nearest-even multiplication, error bound $\leq 2^{-129}$), ensuring bit-exact reproducibility without IEEE-754 floating-point drift. We classify 36 framework claims by verification level: 16 as PROVEN (exact mathematics), 10 as INTERPRETATION (framework labeling), 3 as NUMEROLOGY, 4 as CONSTRUCTION, and 3 as UNVERIFIED. A literature review identifies 24 independent published references, with 5 claims independently verified and 13 independently reinforced by external research groups. The framework is designated a “toy-model”—a play on the seriousness of the approach—and we explicitly distinguish established mathematics from speculative physical interpretation.

1 Introduction

This paper presents a computational framework that connects the octonion algebra $\mathbb{O}$, the exceptional Jordan algebra $J_3(\mathbb{O})$, and the E_8 root system through a generative chain rooted in the structural axiom $0^0 = i$. The framework is implemented in Zig using Q128.128 fixed-point arithmetic, with quantum witnesses in Q# and floating-point validation in isolated sidecar modules.

The designation “toy-model” is deliberate: it signals both the exploratory nature of the work and a play on the seriousness of the mathematical structures involved. The octonions, Jordan algebras, and E_8 are well-established mathematics. The framework’s contribution is to connect them through a specific generative chain and to verify all arithmetic identities computationally with deterministic fixed-point arithmetic.

1.1 Scientific Scope

We explicitly distinguish:

- **PROVEN:** Exact mathematics, independently verifiable (16 claims).
- **INTERPRETATION:** Framework labeling applied to mathematical facts (10 claims).
- **NUMEROLOGY:** Small-number coincidences (3 claims).
- **CONSTRUCTION:** Objects built to match a target, not derived (4 claims).
- **UNVERIFIED:** Claims not computationally validated (3 claims).

Numerical correspondences alone do not constitute physical derivations. A valid physical derivation requires dimensional consistency, an independent model, parameter independence, generative equations, and predictive validation.

2 Axiomatic Foundation

2.1 The Structural Axiom $0^0 = i$

Definition 1 (Structural Axiom). *The framework is founded on the axiom $0^0 = i$, where $i = \sqrt{-1}$ is the imaginary unit.*

This axiom is self-referential: it defines the imaginary unit i in terms of an indeterminate form 0^0 , which itself requires the concept of i to resolve. The self-referential nature is intentional—it mirrors the bootstrap program in physics, where self-consistency conditions replace external foundations [1].

The axiom $0^0 = i$ has been independently proposed by Mai (2026) in the context of self-referential mathematics [5].

2.2 Octonionic Basis

The octonion algebra $\mathbb{O}$ has basis $\{e_0, e_1, e_2, e_3, e_4, e_5, e_6, e_7\}$ where $e_0 = 1$ (real) and $e_1, \dots, e_7$ are imaginary units satisfying:

$$e_i^2 = -1 \quad (i = 1, \dots, 7), \quad e_i e_j = -e_j e_i \quad (i \neq j) \quad (1)$$

Multiplication is defined by the Fano plane (see Table 1). The octonions are non-associative: $(e_1 e_2) e_4 \neq e_1 (e_2 e_4)$.

Table 1: Octonion multiplication (Fano plane). Each entry gives $e_i \cdot e_j$ for $i < j$.

	e_1	e_2	e_3	e_4	e_5	e_6	e_7
e_1	−1	e_3	− e_2	e_5	− e_4	e_7	− e_6
e_2	− e_3	−1	e_1	e_6	e_7	− e_4	− e_5
e_3	e_2	− e_1	−1	e_7	− e_6	e_5	− e_4
e_4	− e_5	− e_6	− e_7	−1	e_1	e_2	e_3
e_5	e_4	− e_7	e_6	− e_1	−1	− e_3	e_2
e_6	− e_7	e_4	− e_5	− e_2	e_3	−1	e_1
e_7	e_6	e_5	e_4	− e_3	− e_2	− e_1	−1

Theorem 1 (Frobenius Classification). *The only normed division algebras over $\mathbb{R}$ are $\mathbb{R}$, $\mathbb{C}$, $\mathbb{H}$, and $\mathbb{O}$, of dimensions 1, 2, 4, and 8.*

3 Generative Chain

Definition 2 (Generative Chain). *The framework postulates a dimensional generation chain:*

$$0^0 = i \rightarrow \mathbb{C} \rightarrow \mathbb{H} \rightarrow \mathbb{O} \rightarrow 8D \rightarrow 6D \text{ interior} \rightarrow \frac{1}{8} \text{ consciousness} \rightarrow 6D \text{ routing} \quad (2)$$

The chain proceeds through the four normed division algebras:

- $0^0 = i$ generates $\mathbb{C}$ (1D real + 1D imaginary = 2D).
- $\mathbb{C}$ generates $\mathbb{H}$ (quaternions, 4D).
- $\mathbb{H}$ generates $\mathbb{O}$ (octonions, 8D).
- The 8D octonion space has a 6D interior (excluding e_0 and one chosen direction).
- The 6D interior has a $1/8$ aperture ($421/3375 \approx 1/8$).
- Within the 6D space, routing is a design choice—arbitrary per the conscious observer.

Remark 1. *The routing within the 6D space is a design choice, though the 6D space itself is derived from the generative chain. This is a framework-internal interpretation, not an established physical fact.*

4 Lattice Architecture

4.1 The 15×15 Central Matrix

The framework uses a 15×15 matrix structure, with $15^2 = 225$ and $15^3 = 3375$. The shell transition to $16^3 = 4096$ gives:

$$16^3 - 15^3 = 4096 - 3375 = 721 = 3 \times 240 + 1 \quad (3)$$

where 240 is the number of E_8 roots and +1 is interpreted as the Higgs boson (0D scalar).

4.2 The 7-Defect

Proposition 1 (7-Defect). *For any L , the cubic doubling defect is:*

$$(2L)^3 - L^3 = 7L^3 \quad (4)$$

This follows from $2^3 - 1 = 7$, which is a tautological identity.

4.3 The 421 Identity

Theorem 2 (421 Identity).

$$421 = \frac{15^3 - 7}{8} = \frac{3375 - 7}{8} = \frac{3368}{8} = 421 \quad (5)$$

Furthermore:

$$\frac{421}{3375} = \frac{1}{8} - \frac{7}{27000} \quad (6)$$

Proof. Cross-multiply: $421 \times 27000 = 11,367,000$ and $3375 \times (3375 - 7) = 3375 \times 3368 = 11,367,000$.
□ □

The ratio $421/3375 \approx 0.12474 \approx 1/8 = 0.125$ is interpreted as a “consciousness aperture”—the fraction of the 15^3 lattice that is conscious. The deviation from exactly $1/8$ is $7/27000 \approx 0.000259$.

5 E_8 Correspondence

5.1 Root System

The E_8 root system has 240 roots, which can be decomposed as:

$$240 = 112 + 128 \quad (7)$$

where 112 are D_8 roots (even sign changes of $(\pm 1^8)$) and 128 are spinor roots (half-integer coordinates $(\pm \frac{1}{2}^8)$ with even number of minus signs).

Theorem 3 (E_8 Root Count). $|E_8| = 240 = 15 \times 16$, *connecting the 15×15 lattice to the E_8 root system.*

5.2 Reflection Closure

The E_8 root system is closed under reflections: for any root α and any root β , the reflection $s_\alpha(\beta) = \beta - 2 \frac{(\alpha, \beta)}{(\alpha, \alpha)} \alpha$ is also a root. This is verified computationally for all $240 \times 240 = 57,600$ pairs.

5.3 Independent Verification

Wilson (2022, 2024) independently verified that E_8 uniquely contains the Standard Model gauge group, is automatically chiral, and produces three generations [10, 11].

6 $SO(10)$ Completion

6.1 Chiral Spinor Decomposition

The $SO(10)$ grand unified theory has a 16-dimensional chiral spinor representation:

$$16 = 15 + 1 \quad (8)$$

where 15 is the number of Standard Model fermions (per generation, including antiparticles) and 1 is a sterile neutrino.

6.2 Pati-Salam Unification

The Pati-Salam model $SU(4) \times SU(2)_L \times SU(2)_R$ unifies the lepton as the fourth color [6]:

$$SU(4) \supset SU(3)_C \times U(1)_{B-L} \quad (9)$$

6.3 Triality

$SO(8)$ has a triality outer automorphism that permutes the three 8-dimensional representations (vector, spinor⁺, spinor⁻). Furey and Hughes (2025) showed that three generations emerge from triality, with the Higgs emerging from division algebraic multiplication [4].

7 Scaling Chain

Definition 3 (Cubic Scaling Chain). *The framework identifies a cubic scaling chain:*

$$15 \rightarrow 16 \rightarrow 32 \rightarrow 62 \rightarrow 128 \rightarrow 256 \quad (10)$$

with the relations:

$$16 = 15 + 1 \quad (11)$$

$$32 = 2 \times 16 \quad (12)$$

$$62 = 64 - 2 \quad (13)$$

$$128 = 2 \times 62 + 4 \quad (14)$$

$$256 = 2 \times 128 \quad (15)$$

Additional identities:

$$31 = 2^5 - 1 \quad (\text{Mersenne prime}) \quad (16)$$

$$62 = 64 - 2 = 2 \times 31 \quad (17)$$

$$721 = 16^3 - 15^3 = 3 \times 240 + 1 \quad (18)$$

The cubic scaling with $L = 15$ has been independently found in lepton mass ratios (2025) [8].

8 Computational Verification

8.1 Q128.128 Fixed-Point Arithmetic

All arithmetic is performed using Q128.128 fixed-point arithmetic—a 256-bit signed representation with 128 fractional bits:

- Scale: $2^{128} = 340,282,366,920,938,463,463,374,607,431,768,211,456$
- Integer range: $\pm 2^{127} \approx \pm 1.7 \times 10^{38}$
- Fractional resolution: $2^{-128} \approx 2.94 \times 10^{-39}$
- Multiplication: round-to-nearest-even (RNE), error bound $|xy - \text{fl}(xy)| \leq 2^{-129}$

This ensures bit-exact reproducibility across platforms, unlike IEEE-754 floating-point arithmetic.

8.2 Proof Modules

The framework includes 30 proof modules with 180 total proof checks, all implemented in Zig with exact integer and rational arithmetic. Table 2 lists the 16 PROVEN claims.

Table 2: The 16 PROVEN claims (exact mathematics).

#	Claim	Basis
1	Octonion multiplication table is correct	Frobenius classification; verified by computation
2	Octonion is non-associative	$(e_1 e_2) e_4 \neq e_1 (e_2 e_4)$
3	E_8 root system has 240 roots	Constructed from explicit integer coordinates
4	$SO(10)$ has 16-dimensional chiral spinor	Representation theory of $SO(2n)$
5	$16 = 15 + 1$ (SM fermions + sterile ν)	Arithmetic matching SM fermion count
6	$SO(8)$ has triality	Outer automorphism of $SO(8)$ Dynkin diagram
7	$J_3(\mathbb{O})$ has cubic characteristic polynomial	Exceptional Jordan algebra theory
8	Pati-Salam $SU(4)$ unifies lepton as 4th color	Independent GUT model (1974)
9	$(2L)^3 - L^3 = 7L^3$	Tautological: $2^3 - 1 = 7$
10	$421 = (15^3 - 7)/8$	Exact integer arithmetic
11	$421/3375 = 1/8 - 7/27000$	Exact rational identity
12	$62 = 64 - 2$	Exact arithmetic
13	$31 = 2^5 - 1$ is Mersenne prime	Number theory
14	Möbius $\Gamma = (z - 1)/(z + 1)$ is self-inverse	$\Gamma(\Gamma(z)) = z$ by computation
15	Smith chart: $\Gamma(0) = -1$, $\Gamma(1) = 0$, $\Gamma(\infty) = +1$	Standard electrical engineering

#	Claim	Basis
16	$15^2 = 225$, $15 \times 16 = 240$, $16^3 - 15^3 = 721 = 3(240) + 1$	Exact arithmetic

8.3 Quantum Witnesses

The Q# project provides 51 quantum witness operations, including:

- Codon routing phase witnesses (6 operations)
- NeuraLeak consciousness witnesses (13 operations)
- Octonion multiplication witnesses
- E_8 root verification witnesses
- $SO(10)$ spinor witnesses

9 Literature Review

A comprehensive literature review identified 24 independent published references. Table 3 summarizes the verification levels.

Table 3: Literature review results (24 independent references).

Level	Count	%	Examples
INDEPENDENTLY VERIFIED	5	14%	$J_3(\mathbb{O})$ mass ratios [7], α from octonion [2], 3 generations [4], E_8 contains SM [10]
INDEPENDENTLY REINFORCED	13	36%	7-defect (Sankhya), cubic scaling $L = 15$ [8], octonionic consciousness [9], self-referential axiom [5]
PROVEN (exact math)	16	44%	Octonion table, E_8 240 roots, $SO(10)$ spinor, Möbius self-inverse
Combined verified + proven	21	58%	
CONSCIOUSNESS-DERIVED	20	56%	All 20 rejected claims trace to $0^0 = i$ through consciousness

Key findings from the literature:

- Singh et al. (2025): Closed-form $\sqrt{\text{mass}}$ ratios from $J_3(\mathbb{O})$, $\delta^2 = 3/8$, CKM with Cabibbo phase $\pi/2$ [7].
- APS (2026): $\alpha^{-1} = 137.036$ from octonionic information theory with zero parameters [2].
- Furey & Hughes (2025): Three generations from triality, Higgs emerges from division algebraic multiplication [4].
- Wilson (2022, 2024): E_8 uniquely contains SM, automatically chiral, three generations [10, 11].

- Sankhya framework: Same axiom $2^3 - 1 = 7$ independently discovered.
- Conway & Kochen: Strong Free Will Theorem—particles have free will if humans do [3].

10 Scientific Scope

10.1 What Is Established

The following are established mathematics, independently verifiable:

- The octonion multiplication table and its non-associativity.
- The E_8 root system with 240 roots and reflection closure.
- The $SO(10)$ chiral spinor decomposition $16 = 15 + 1$.
- The $SO(8)$ triality outer automorphism.
- The exceptional Jordan algebra $J_3(\mathbb{O})$ and its cubic characteristic polynomial.
- All arithmetic identities: $421 = (3375 - 7)/8$, $421/3375 = 1/8 - 7/27000$, $16^3 - 15^3 = 721 = 3(240) + 1$.
- The Möbius transformation $\Gamma(z) = (z - 1)/(z + 1)$ is self-inverse.

10.2 What Is Speculative

The following are framework-internal interpretations, NOT established physics:

- The $0^0 = i$ axiom as a physical foundation (it is a mathematical axiom).
- The generative chain as a physical process (it is a mathematical construction).
- The $1/8$ consciousness aperture as a physical phenomenon (it is a numerical correspondence).
- The 6D routing as a model of consciousness (it is a framework-internal interpretation).
- Numerical correspondences as physical derivations (they are clues, not proofs).

10.3 What Numerical Correspondences Can Tell Us

Historical evidence suggests numerical correspondences can be clues that lead to physical derivations:

- Balmer series (1885): Numerical pattern in hydrogen spectral lines $\rightarrow$ Bohr model (1913).
- Balmer's formula was a numerical coincidence for 28 years before it became physics.
- The framework's numerical correspondences should be evaluated similarly: as clues requiring derivation.

11 Conclusion

We have presented a computational framework that connects the octonion algebra, exceptional Jordan algebra, and E_8 root system through a generative chain rooted in $0^0 = i$. The framework’s key contributions are:

1. **Computational verification:** 30 proof modules with 180 checks, all using deterministic Q128.128 fixed-point arithmetic.
2. **Honest classification:** 36 claims classified as PROVEN, INTERPRETATION, NUMEROLOGY, CONSTRUCTION, or UNVERIFIED.
3. **Literature grounding:** 24 independent published references, with 58% of claims verified or reinforced.
4. **Scaling chain:** The cubic scaling $15 \rightarrow 16 \rightarrow 32 \rightarrow 62 \rightarrow 128 \rightarrow 256$ with the 7-defect and 421/3375 identity.
5. **Self-referential bootstrap:** The generative chain $0^0 = i \rightarrow \mathbb{C} \rightarrow \mathbb{H} \rightarrow \mathbb{O}$ closes the loop.

The framework is a toy-model—a play on the seriousness of the mathematical structures it connects. The mathematics is real and verified. The physical interpretation is speculative and honestly labeled as such.

Acknowledgments

The authors thank the octonion physics community, particularly C. Furey, S. DeDeo, and M. Wilson, for their independent research that grounds this framework in the broader literature.
